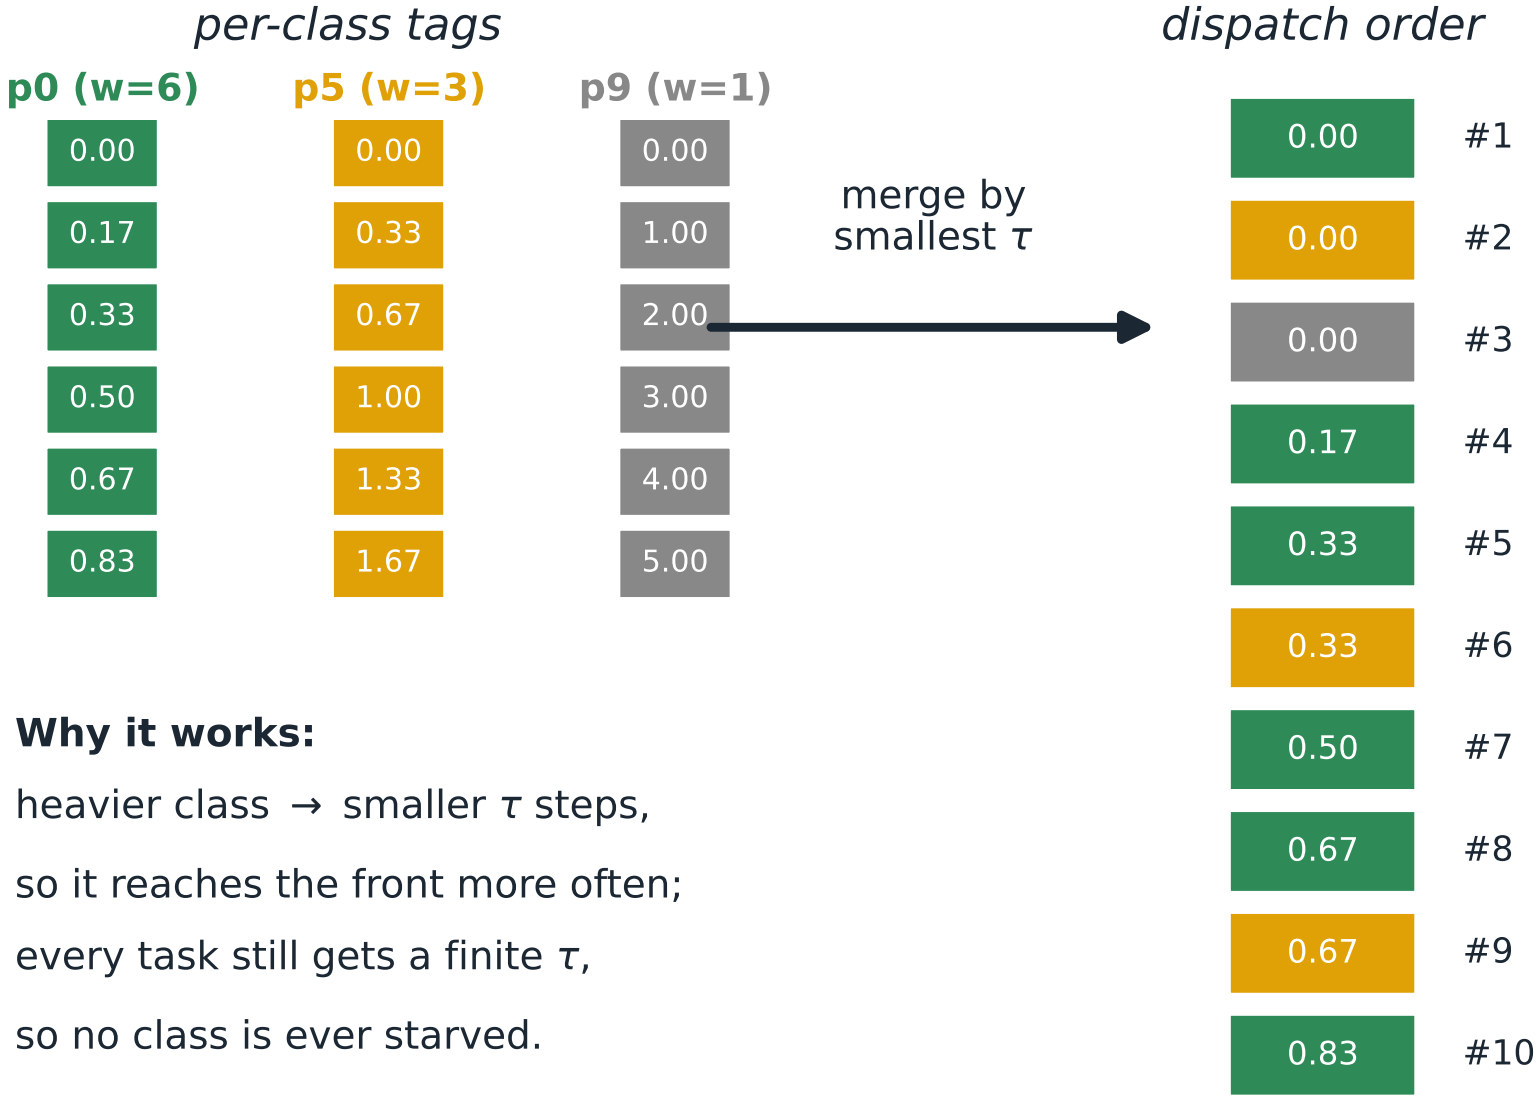
weighted virtual-time tags $\tau = k/w_c$

stamp each task once, then always dispatch the smallest τ



Why it works:

heavier class → smaller τ steps,

so it reaches the front more often;

every task still gets a finite τ,

so no class is ever starved.

after 10 slots: p0:p5:p9 = 6:3:1

p0 (w=6) p5 (w=3) p9 (w=1)
